pBluescript SK; Site_1: EcoRI; Site_2: XhoI; Seeds were
surface-sterilized, germinated and grown aseptically in
the dark at room temperature on filter paper with water,
nystatin and cefotaxime in covered crystallization
dishes. Roots were harvested. The tissue, total RNA, and
poly(A) RNA were prepared, a cDNA library was made in the
TJ Close lab (Choi, Close, Fenton) at the University of
California, Riverside. The cDNA clones were in vivo
                                                                                                                                                                                                                                                excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyer lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oandersn@pw.usda.gov
                                                 California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyer lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                     dishes. Roots were harvested. The tissue, total RNA, poly(A) RNA were prepared, a cDNA library was made i TJ Close lab (Choi, Close, Fenton) at the University
                                                                                                                                                                                                                                                                                                                                 pBluescript SK; Site_1: EcoRI; Site_2: Xhoī; Seeds were surface-sterilized, germinated and grown aseptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization
                                                                                                                                                                                                                                                                                                                                                                                                                                        /tissue_type="Root"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note-"Vector: Lambda Uni-ZAP XR, excised phagemid /note-"Vector: Kambda Uni-ZAP XR, excised phagemid pBluescript SK; Site_1: EcoRI; Site_2: XhoI; Seeds were surface-sterilized, germinated and grown aseptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The cDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of normalization was carried out.
                                                                                                                                                                                                                                                                                                                                     phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech Univeristy. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

Plants were grown in the greenhouse at the University of 
California, Riverside (Fenton, SJ Close, TJ Close), Whole 
spikes with awns trimmed were collected at 5, 10, 15, 20, 
30 and 45 DAP (Fenton). Total RNA was prepared from each 
pool, equal quantities of all six RNA pools were combined, 
poly(A) RNA was purified from the mixture, one primary 
unamplified cDNA library was made, and 1 million pfu were 
in vivo excised to give pBluescript SK(-) cDNA phagemids 
(Choi); In the TJ Close lab at the University of California, 
Riverside. Phagemids were plated and picked at the Clemson 
University Genomics Institute (CUGI) (Begum, Palmer, 
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA 
sequencing and sequence analysis were performed at CUGI 
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). 
The sequence has been trimmed to remove vector sequence 
and contains a minimum of 100 bases of phred value 20 or 
above.

/note="Vector: Lambda Uni-ZAP XR, excised phagemid
pBluescript SK; Site_1: EcoRI; Site_2: XhoI; Seeds were
surface-sterilized, germinated and grown aseptically in
the dark at room temperature on filter paper with water,
nystatin and cefotaxime in covered crystallization
dishes. Roots were harvested. The tissue, total RNA, and
poly(A) RNA were prepared, a cDNA library was made in the
TJ Close lab (Choi, Close, Fenton) at the University of
California, Riverside. The cDNA clones were in vivo
excised to give pBluescript phagemids before
normalization was carried out. The mass excision of
phagemid library and normalization were done in HT Nguyen
lab by D. Zhang at Texas Tech University. Normalization
proparations and DNA sequencing were performed in the OD
Anderson lab (all other authors)."

Five-day old seedlings were incubated at 5oC for 2 days. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations , DNA sequence mass been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or actor in the contains a minimum of 100 bases of phred value 20 or

      The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene amplification primer rpoB-F (bp 2201-2220). It is used with the reverse primer given in AAA49824 and with the sequencing primers given in AAA49825 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rpoB gene fragment amplified using the primer set AAT12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybrids formed and inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method is partic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the
                     analysis of antibiotic resistance-associated mutations in def
regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR
(isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 16S/I
(streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA
                                                                                                                               rpoB (rifampin resistance) gene sequencing primer rpoB-5s (bp 2201-2220). It is used with the reverse primer given in AAA49826 and with the amplification primers given in AAA49823 and AAA49824 for the detection and analysis of antibotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and

Claim 22; Page 39; 69pp; English. patterns primers for determn. of antibiotic resistance spectrum of ium, opt. coupled with species identification - from patterns of hybridisation with rpoB gene

The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rpoB gene fragment amplified using the primer set AAT12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybrids formed and inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method is partic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn. and spp. identity. at be

Method for the detection and characterization of Mycobacterium tuberculosis with antibiotic resistance in a sample -

Claim 4; Page 4; 43pp; English.

rpoB (rifampin resistance) gene amplification primer rpoB-F (bp 2201-220). It is used with the reverse primer given in AAA49824 and with the sequencing primers given in AAA49825 and AAA49825 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined The present sequence is that of the Mycobacterium tuberculosis of rpoB

> (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/sl2 and 23S genes for the presence of antibiotic inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as antibiotic treatment outlone. antibiotic treatment options (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), (streptomycin), embB (ethambutol), pncA (pyrazinamide), (ciprofloxacin) and 23S (azithromycin) genes of M. tuber rpsL/s12 (streptomycin), 16S/rrs gyrA ç

Claim 4; Page 5; 43pp;

The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene sequencing primer rpoB-5s (bp 2201-2220). It is used with the reverse primer given in AAA49826 and with the amplification primers given in AAA49823 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpsL/sl2 (streptomycin), lower control of the detection and regions of mathibotic resistance-associated mutations in defined regions of mathibotic resistance associated mutations and mat (ciprofloxacin) and 23S (azithromycin) genes of (streptomycin), embB (ethambutol), pncA (pyrazinamide),

No. 1s the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                  Score

Patent No. GENERAL I APPLICANT: Honore, Nadine
APPLICANT: Telenti, Amalio
APPLICANT: Bodner, Thomas
TITLE OF INVENTION: Rapid Detection of Antibiotic Resistance
TITLE OF INVENTION: in Mycobacterium Tuberculosis
NUMBER OF SEQUENCES: 66 CORRESPONDENCE ADDRESS: STREET: 1300 I STATE: Washington ADDRESSEE: Finnegan, Henderson, ADDRESSEE: Dunner STREET: 1300 I Street, N.W. 59, 585176 585176 INFORMATION: Heym, Beate Cole, Stewart Young, Douglas Zhang, Ying Farabow, Garrett &

STRANDEDNESS: single;
TOPOLOGY: linear;
MOLECULE TYPE: DNA (ger US-08-313-185-59 NAME: Meyers, Kenneth J.
REGISTRATION NUMBER: 25,146
REFERENCE/DOCKET NUMBER: 0235/
TELECOMMUNICATION INFORMATION:
TELEPHONE: (202) 408-4000
TELEPAX: (202) 408-4400
INFORMATION FOR SEQ ID NO: 59:
SEQUENCE CHARACTERISTICS:
LENGTH: 432 base pairs
TYPE: nucleic acid COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA: ATTORNEY/AGENT INFORMATION: APPLICATION NUMBER: US/08/313,185 FILING DATE: 12-OCT-1994 CLASSIFICATION: 435 COUNTRY: USA ZIP: 20005-3315 DNA (genomic) 02356.0068-00000
